

OINTMENT

# Alpha Kadol<sup>®</sup>

chymotrypsin complex & phenylbutazone

### Composition:

Each 100 g contains: Chymotrypsin complex  
(endopeptidase natural pancreatic origin) ————— 2,500,000 U.  
Phenylbutazone ——— 5g  
Excipient ad to ——— 100 g

### Properties:

- Alpha-kadol ointment contains alphachymotrypsin & phenylbutazone. They are two locally extremely active anti-inflammatory agents. They act complementary to each other by a different mechanism.
- Phenylbutazone combats capillary vasodilatation, thus suppressing redness & hotness, the first two signs of inflammation.
- Alphachymotrypsin, by its fibrinolytic action, disaggregates the fibrin network, this will lead to the removal of oedema which causes swelling.
- Thus, the pain due to irritation of nerve endings by oedema, disappears.
- By this complementary action, Alpha-Kadol helps to ease off the 4 main signs of inflammation.
- The synergistic action of the two active ingredients in Alpha-Kadol is superior than the anti-inflammatory action of each component separately.

### Indications:

I) In traumatology: all trauma and superficial contusions: oedema, ecchymosis, hematoma, sprains, ligamentary elongations, torn muscles and post-fracturary oedema.

II) In phlebology: superficial phlebitis, varicose peri-phlebitis, post-phlebitic oedema.

III) In surgery : oedema and post-operative hematoma.

IV) Cutaneous disorders : furuncles, anthrax, lymphangitis, adenitis etc...

V) Miscellaneous : burns, chilblains, insect bites.

### Contra- Indications:

Acute eczema

### Administration:

Apply the ointment in small quantities two or three times daily, careful massage to the affected area.

### Caution:

- Avoid the application over the open wounds & near the eyes.

### Presentation:

Tubes of 35 g.
